ACKNOWLEDGEMENT

The development and evolution of this project has been a never-ending source of both challenges and joy to us. The euphoria and satisfaction that accompanies the success of our project would be complete only with the mention of the people and the organization that made it possible, whose support rewarded our effort with success.

First and the foremost, I would like to thank with immense gratitude to our beloved Principal **Prof. Shruthy Harita** for his continuous encouragement and moral support which has been the key for the successful completion of the project.

I express my gratitude to **Prof. Jyothi N**, Head of Department of Computer Applications for her encouragement and support in successful completion of the project.

I would like to express my heart-felt gratitude to my guide **Mrs. Swathi N M**, Asst. Professor her valuable suggestions and excellent guidance rendered throughout this project.

Finally, I thank my parents and all my friends for helping and encouraging me during the period of my project.

ABSTRACT

The **Inventory Management System** is a MERN stack–based web application designed to efficiently monitor, manage, and control the stock of products within a grocery store environment. The system provides distinct roles for **Admin** and **Staff** users, ensuring secure and role-based access. Admins can manage staff accounts, suppliers, and products, as well as view reports on sales, purchases, and profit-loss analysis. Staff members can handle day-to-day operations such as generating bills for customers and can view product details.

The system automates traditional inventory tracking methods by providing a centralized, real-time platform for managing goods, suppliers, and transactions. It helps minimize human error, reduces time spent on manual record-keeping, and provides insightful analytics through dynamic charts and reports. Additionally, the system enables suppliers to accept restock requests, thereby ensuring smooth coordination across all stakeholders.

This project aims to simplify store management operations, improve accuracy, and enhance overall business productivity by leveraging the power of modern web technologies such as **MongoDB**, **Express.js**, **React.js**, and **Node.js**. The solution ultimately supports data-driven decision-making and ensures that the store maintains optimal stock levels at all times.
